Modality	MR		

WE CROSS THIS DOCUMENT TO PREVENT FROM MISUSE

Brain and Orbit
MRI of brain & orbits has been performed using T1, T2W, FLAIR Diffusion and gradient sequence in multiple planes.

Imaging Features:-

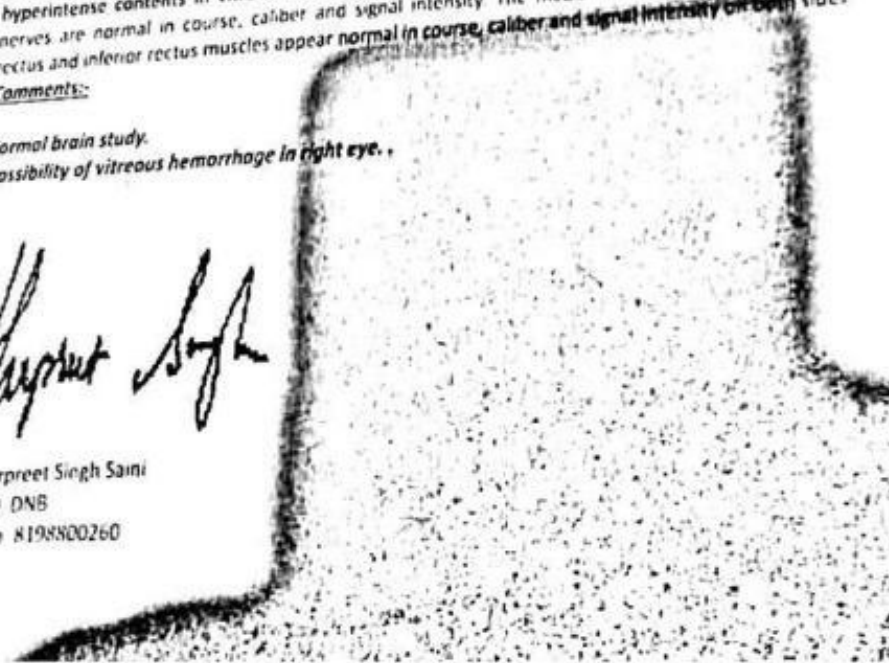

Brain parenchyma appears normal. Bilateral basal ganglia and thalami are symmetrical and reveal normal signal intensity. The brainstem and cerebellum appear normal. There is no evidence of cerebellar tonsil ectopia. Corpus callosum appears normal. There is no evidence of sellar widening. The ventricular system is normal. No abnormal extra-axial fluid is seen. No focal mass lesion is seen. No acute infarct is seen on diffusion sequence. No abnormal susceptibility is seen on gradient sequence to suggest hemorrhage. The grey white differentiation is preserved. Normal intracranial flow voids are well visualized. Limited evaluation of paranasal sinuses does not reveal any significant abnormality.

MRI ORBIT,
Both the globes appear normal except for right eyeball which shows mildly T1 hyperintense and T2 hyperintense contents in vitreous suggestive of possibility of vitreous hemorrhage. Both the optic nerves are normal in course, caliber and signal intensity. The medial rectus, lateral rectus, superior rectus and inferior rectus muscles appear normal in course, caliber and signal intensity on both sides.

Comments:-

Normal brain study.
Possibility of vitreous hemorrhage in right eye.
